## BIOGRAPHY.

PROFESSOR FELIX KLEIN.

BY DR. GEORGE BRUCE HAISTED.

THE eminent subject of this very imperfect sketch was born on the twenty-fifth of April 1849 in Duesseldorf. His mother was Elise Sophie *nee* Kayser; his father, the "Landrentmeister" Caspar Klein, both of the protestant faith. For eight years, from the autumn of 1857 to the autumn of 1865 he attended the Duesseldorf Gymnasium, and went thence to the University of Bonn, for the study of mathematics and the natural sciences, especially physics. Here he had the extraordinary good fortune to come into close relations with the great Professor Pluecker, who gave him the position of assistant in the physical institute of Bonn, and used his help in writing out his profoundly original and stimulating mathematical works.

The death of Pluecker May 22nd 1868 closed this formative period, of which the influence on Klein can not be over estimated. So mighty is the power of contact with the living spirit of research, of taking part in original work with a master, of sharing in creative authorship, that any one who has once come intimately in contact with a producer of the first rank must have had his whole mentality altered for the rest of his life.

The gradual development, high attainment, and then continuous achievement of Felix Klein are more due to Pluecker than to all other influences combined. His very mental attitude in the world of mathematics constantly recalls his great maker.

Of others whose lectures he attended, we may mention Argelander and Lipschitz, to the latter of whom particularly he has expressed his gratitude for kindly and efficient guidance and aid in his studies. Klein took his doctor's

PROFESSOR FELIX KLEIN.

degree at Bonn on December 12th 1868 with a dissertation "On the transformation of the general equation of the second degree between line-coordinates to a canonic form," a subject taken from the analytic line-geometry of his master Pluecker. A line-complex of the  $n$ th degree contains a triply infinite multitude of straights, which are so distributed in space, that those straights which go through a fixed point make a cone of the  $n$ th order, or, what is the same, that those straights which lie in a fixed plane envelop a curve of the  $n$ th class. Such an aggregate or form finds its analytic representation through the coordinates of the straight in space, introduced by Pluecker. According to Pluecker the straight has six homogeneous coordinates which fulfill an equation-of-condition of the second degree. By means of these the straight is determined with reference to a coordinate-tetrahedron. A homogeneous equation of the  $n$ th degree between these coordinates represents a complex of the  $n$ th degree.

The dissertation transforms the equation of the second degree between line-coordinates to a canonic form, in correspondence with a change of the coordinate-tetrahedron. It first gives the general formulas to be applied in such a transformation.

From these the problem appears algebraically as the simultaneous linear transformation of the complex to a canonic form, and of the equation-of-condition, which the line coordinates must fulfill, into itself. In carrying out these transformations, it attains to a classification of the complexes of the second degree into distinct species.

The dissertation is dedicated to Pluecker and contains eight specific references to Pluecker's "Neue Geometrie des Raumes, gegründet auf die Betrachtung der geraden Linie als Raumelement." It is lucid and simple, but for depth and promise contrasts sharply with the great dissertation of Riemann, that "book with seven seals."

It may be interesting, as characteristic of this germinating state, to note that of his five theses the second calls attention to one of Cauchy's slips in logical rigor, slips now known to be so numerous that C. S. Peirce makes of them a paradox, maintaining that fruitfulness of Cauchy's work is essentially connected with its logical inaccuracy.

The third thesis declares the assumption of an ether unavoidable in the explanation of the phenomena of light.

The last thesis is the desirability of the introduction of newer methods in Geometry alongside the Euclidean in gymnasial teaching.

This serves, it seems, to emphasize my point that the long eight years of gymnasial so-called *training* left the seed still dormant, and only in Pluecker did it find the rain and the sun to call it to life and growth.

Within two years now the development is amazing. Already in 1870 he is working with another great genius, Sophus Lie; and in 1871 is presented to the Goettingen Academy of Science his epoch-making paper, "Ueber die sogenannte Nicht-Euklidische Geometrie." Its aim is to present the mathematical results of the non-Euclidean geometry, in so far as they pertain to the

theory of parallels, in a new, intuitive way; its instrument is the mighty projective geometry, which he proves independent of all question of parallels. He perfects the projective metrics of Cayley by founding cross-ratio, after von Staudt, wholly without any use or idea of measurement. Then can be constructed a general projective expression for distance, related to an arbitrary surface of the second degree as Fundamental-surface (Cayley's Absolute). This projective metrics then gives, according to the species of Absolute used, a picture of the results of the parallel-theory in the space of Lobachewsky, of Euclid, of Riemann. But not merely a picture; they coincide to their innermost nature.

The paper begins by stating that, as well-known, the eleventh axiom of Euclid is equivalent to the theorem that the sum of the angles in a triangle equals two right angles. Legendre gave a proof that the angle-sum in a triangle cannot be greater than two right angles; but this proof, like the corresponding one in Lobachevsky, assumes the infinite length of the straight.

Drop this assumption, and the proof falls, else would it apply in surface spherics. Legendre showed further, that if in one triangle, the angle-sum is two right angles, it is so in every triangle. We now know that this had been proven long before by Saccheri. But Professor Klein said that he heard the name of Saccheri for the first time in my address before the World's Science Congress. But it is claimed for Gauss that he was the first to distinctly state his conviction of the impossibility of proving the theorem of the equality of the angle-sum to two right angles. But it does not follow, as claimed by his Goettingen worshippers, that Gauss ever came to the conviction that a valid non-Euclidean geometry was possible until after it had been made simultaneously by John Bolyai and Lobachevsky, and perhaps long before by Wolfgang Bolyai. Certainly the world did not hear of it from Gauss. He published nothing on it.

In this non Euclidean geometry there appears a certain constant characteristic for the metrics of the space. By giving this an infinite value we obtain the ordinary Euclidean geometry. But if it has a finite value, we get a quite distinct geometry, in which, for example, the following theorems hold: The angle sum in a triangle is less than two right angles, and indeed so much the more so the greater the surface of the triangle. For a triangle whose vertices are infinitely separated, the angle-sum is zero. Through a point without a straight one can draw two parallels to the straight, that is, lines which cut the straight on the one or the other side in a point at infinity. The straights through the point which run between the two parallels nowhere cut the given straight. But on the other hand, in Riemann's marvellous inaugural lecture, "Ueber die Hypothesen, welche der Geometrie zu Grunde liegen," is pointed out that the unboundedness of space, which is experiential, does not carry with it the infinity of space.

It is thinkable, and would not contradict our perceptive intuition, which always relates to a finite piece of space, that space is finite and comes back into itself.

The geometry of our space would then be like that of a tridimensional sphere in a four dimensional manifoldness. This representation carries with it that the angle-sum in a triangle, as in ordinary spherical triangles, is greater than two right angles, and indeed the more so, the greater the triangle. The straight would then have no point at infinity, and through a given point no parallel to a given straight could be drawn. Now Cayley constructed his celebrated projective metrics to show how the ordinary Euclidean metrics may be taken as a special part of projective geometry. Klein generalizes Cayley and founds three metric geometries, the elliptic (Riemann's), the hyperbolic (Lobachevsky's), the parabolic (Euclid's).

This little paper of 1871 contains the promise of much that is most genial in the after work of a man now generally considered as the most interesting and one of the very greatest of living mathematicians. Of all those splendid and charming series of lectures with which Klein has made Goettingen so attractive to the whole world, the most delightful and epoch-making are those on non-Euclidean geometry, (*Nicht-Euklidische Geometrie*, I. Vorlesung, gehalten während des Wintersemesters 1889-90 von F. Klein, Ausgearbeitet von Fr. Schilling. Zweiter Abdruck. Goettingen 1893. Small Quarto, lithographed, pp. v. 365. II. Sommersemesters 1890. Zweiter Abdruck 1893. pp. iv. 238.)

The World's Science Congress at Chicago was in nothing more fortunate than in the presence of Helmholtz and Felix Klein, and in the spontaneous and universal homage accorded them no idea was more often emphasized than their connection with the birth and development of that wonderful new world of pure science typified in the non-Euclidean geometry.

The narrow limits of this feeble sketch prevent the statement of how much promise, richly fulfilled in the development of this many-sided man, in totally other directions is contained in a little-known paper of 1873, "Ueber den allgemeinen Functionsbegriff und dessen Darstellung durch eine willkürliche Curve."

Twenty years of production and achievement have not in the least dampened the ardour of this enthusiastic mind. This very summer at the great meeting of scientists in Vienna Klein seemed the busiest, the foremost of all that goodly company.

## ISOPERIMETRY WITHOUT CURVES OR CALCULUS.

By Professor P. H. PHILBRICK, M. Sc., C. E., Lake Charles, Louisiana.

[Continued from the November Number.]

PROPOSITION VII. If in a quadrilateral two sides are equal, and the

other two sides are also equal; the quadrilateral may be inscribed either with the equal sides adjacent giving  $ABCD$ , or with the equal sides opposite giving  $ABCD'$ .

For  $AC$  is a diameter of the circumscribing circle in either case.

PROPOSITION VII. To find the polygon of  $n$  sides of given perimeter and maximum area.

Let  $ABCDEF$  etc. represent the polygon.

Draw the diagonal  $AC$ , and suppose the sides  $AB$  and  $BC$  to vary, while the other sides remain fixed in magnitude and position, and we prove, as in Proposition II, that the area of  $ABC$ , and consequently of the polygon is a maximum, when  $AB=BC$ . Similarly  $BC=CD$ ,  $CD=DE$ , etc.

Therefore the polygon is equilateral.

Draw the diagonal  $AD$ . Then supposing  $AB$ ,  $BC$  and  $CD$  to vary in position, while the other sides remain entirely fixed, we prove, as in Proposition V, that the angles at  $B$  and  $C$  are equal. We prove in the same way that the angles are equal at  $C$  and  $D$ , at  $D$  and  $E$ , etc; and hence the angles are all equal.

The polygon is therefore both equilateral and equiangular (that is regular) and is inscribable in a circle.

PROPOSITION VIII. Of all Polygons having the same area and the same number of sides, the regular polygon has the maximum perimeter.

For let  $P$  be a regular polygon and  $M$  any irregular polygon, having the same number of sides and area.

Now if the perimeter of  $P$  was equal to that of  $M$  then (Prop. VII) the area of  $P$  would be greater than that of  $M$ , but since it is equal to that of  $M$  its perimeter must be less.

## NON-EUCLIDEAN GEOMETRY: HISTORICAL AND EXPOSITORY.

By GEORGE BRUCE HALSTED, A. M., (Princeton), Ph. D., (Johns Hopkins), Member of the London Mathematical Society; and Professor of Mathematics in the University of Texas, Austin, Texas.

[Continued from the November Number.]

PROPOSITION XII. *Again I say the straight AD somewhere on that side will meet the straight PL (and indeed at a finite, or terminated distance) also in the hypothesis of obtuse angle.*

PROOF. For, as in the preceding proposition,  $DF$  being assumed equal to  $AD$ ; and the just noted perpendiculars let fall, I must show the join  $DM$  will be greater than  $DF$ , or  $DA$ , and therefore (P.X.) the straight  $BM$  will be greater than  $AB$ .

And in the first place  $DM$  will not be equal to  $DF$ . Otherwise the angle  $DMF$  would be equal (Eu. I. 5.) to the angle  $DFM$ , and therefore greater (P.VIII, in the hypothesis of obtuse angle) than the external angle  $XAH$ , or its verticle  $CAD$ .

Wherefore (since the angles  $CLM$ ,  $FML$  are taken equal, as being right) the remaining angle  $DML$  would be less than the remaining angle  $DAM$ . This is absurd (against Eu.1. 5.), if indeed  $DM$  be equal to  $DF$ , or  $DA$ .

But neither is  $DM$  less than  $DF$ , or  $DA$ . Otherwise (Eu.I.18) the angle  $DMF$  would be greater than the angle  $DFM$ , and therefore still greater (in the hypothesis of obtuse angle) than the external angle  $XAH$ , or its verticle  $CAD$ . Wherefore again, as above, the remaining angle  $DML$  would be still less than the remaining angle  $DAM$ . But this is absurd (against Eu.I.18) if indeed  $DM$  be less than  $DF$ , or  $DA$ .

It remains therefore, that the join  $DM$  is greater than  $DF$ , or  $DA$ , and therefore (P.X.)  $BM$  is greater than  $AB$ . Quod erat hoc loco intentum.

Since therefore, assuming in  $AD$  produced the interval  $AP$  double the interval  $BD$ , the perpendicular  $FM$  let fall on the transversal  $AP$  cuts off from it more than double what is cut off by the perpendicular let fall from the point  $D$ ; more quickly by far in this hypothesis of obtuse angle, than in the preceding hypothesis of right angle, we attain to an interval so great, that from it the perpendicular let fall cuts off a base greater than the designated  $AP$  however great.

But this, as in the preceding proposition, could not happen, unless after the meeting of the produced  $AD$  with  $PL$  in some point; and indeed at a finite, or terminated distance. Quod erat etc.

PROPOSITION XIII. *If the straight  $XL$  (of designated length however great) meeting two straights  $AD$ ,  $XL$  makes with them toward the same parts (fig.11) internal angles  $XAD$ ,  $AXL$  less than two right angles; I say, these two (even if neither of those angles be a right angle) at length will mutually meet in some point on the side toward those angles, and indeed at a finite, or terminated distance, if either hypothesis holds, of right angle or of obtuse angle.*

PROOF. For one of the said angles, as  $AXL$  suppose, will be acute.

Accordingly from the vertex of the other angle is dropped the perpendicular  $AP$  on  $XL$ , which certainly (because of Eu. I. 17.) falls on the side of the acute angle  $AXL$ . Since therefore in the triangle  $APX$ , right-angled at  $P$ , the two acute angles

$\angle PAI$ ,  $\angle XAI$ , together are not less (P.IX.) than a right angle, in either hypothesis, of right angle, or of obtuse angle; if these two angles are taken away from the sum of the given angles the then remaining angle  $\angle PIA$  will be less than a right angle. Consequently we will be in the case of the two preceding propositions, since it is obvious that one or the other hypothesis holds, either of right angle, or of obtuse angle.

Wherefore the straights  $AD$ , and  $PL$ , or  $XL$ , meet in some point at a finite, or terminated distance on the side noted, as well under the one, as under the other mentioned hypothesis. Quod erat demonstrandum.

## THE INSCRIPTION OF REGULAR POLYGONS.

By LEONARD E. DICKSON, M. A., Fellow in Pure Mathematics, University of Chicago.

### CHAPTER IV.

[Continued from the November Number.]

We will now consider regular polygons the number of whose sides is a *composite* number. The present chapter will be devoted to the case when  $n$  is divisible by 3.

In the regular polygon of 21 sides, the chord  $A_1 = 1$ ; and  $A_3 - A_6 + A_9 = 1$ , being the chords of a regular 7-gon.

But  $A_1 - A_2 + A_3 - A_4 + A_5 - A_6 + A_7 - A_8 + A_9 - A_{10} = 1$ .

Hence,  $(A_1 - A_8) + (-A_2 + A_5) + (-A_4 - A_{10}) = -1$ .

Now  $(A_1 - A_8)(-A_4 - A_{10}) = -[(-A_4 - A_{10}) + (-A_2 + A_5) + 2(A_3 + A_9)]$ .

$(A_1 - A_8)(-A_2 + A_5) = -[(-A_4 - A_{10}) + (A_1 - A_8) + 2(A_3 - A_6)]$ .

$(-A_2 + A_5)(-A_4 - A_{10}) = -[(A_1 - A_8) + (-A_2 + A_5) + 2(A_6 - A_9)]$ .

The sum of these 3 products  $= -2[(A_1 - A_8) + (-A_2 + A_5) + (-A_4 - A_{10}) + 2(A_3 - A_6 + A_9)] = -2$ .

Again,  $(A_1 - A_8)(-A_2 + A_5)(-A_4 - A_{10}) = (A_2 - A_5)[(-A_4 - A_{10})$

$+ (-A_2 + A_5) + 2(A_3 + A_9)] = (A_1 - A_8) + (-A_2 + A_5) + (-A_4 - A_{10})$

$+ 2(A_3 - A_6 + A_9) = 1$ ; for  $(A_2 - A_5)(A_3 + A_9) = (A_1 - A_8) + (-A_2 + A_5)$

$+ (-A_4 - A_{10}) + 2 = 1$ ; and  $(A_2 - A_5)^2 = 2 + A_4 + A_{10} - 2A_3$ .

$\therefore (A_1 - A_8), (-A_2 + A_5)$  and  $(-A_4 - A_{10})$  are the roots of the cubic

$$x^3 + x^2 - 2x - 1 = 0.$$

But it was shown in Chapter I that the chords  $A_3, -A_6, A_9$  of the regular 7-gon are the roots of  $x^3 - x^2 - 2x + 1 = 0$ .

Thus the two sets of roots are numerically equal but of opposite sign.

$$\therefore A_1 - A_8 = A_6; -A_2 + A_5 = -A_9; A_4 + A_{10} = A_3.$$

We may write these symmetrically:

$$\begin{cases} A_1 - A_8 - A_6 = 0 \\ A_2 - A_5 - A_9 = 0 \\ A_3 - A_4 - A_{10} = 0. \end{cases}$$

$$\text{Now } (-A_1, -A_6 - A_4, A_8 + A_6, A_8) = (A_2 - A_5 - A_9 - 3A_4) = -3.$$

$$A_1, A_6, A_8 = A_1(A_2 - A_4) = A_1 + A_3 - A_6 - A_8 = A_3.$$

$$\text{Hence, } A_1, -A_6, -A_8 \text{ are the roots of } x^3 - 3x - A_3 = 0.$$

$$\text{Similarly, } A_2, -A_5, -A_9 \text{ are the roots of } x^3 - 3x - A_5 = 0.$$

$$A_3, -A_4, -A_{10} \text{ are the roots of } x^3 - 3x - A_3 = 0.$$

*In the regular polygon of 27 sides,  $A_2 = 1; A_3 - A_6 + A_9 - A_{12} = 1$ . But*

$$A_1 - A_2 + A_3 - A_4 + A_5 - A_6 + \dots + A_{13} = 1.$$

$$\therefore (A_1 - A_8 - A_{10}) + (-A_2 + A_7 + A_{11}) + (-A_4 + A_5 + A_{13}) = 0.$$

$$\begin{aligned} \text{Now } (A_1 - A_8 - A_{10})(-A_2 + A_7 + A_{11}) &= -3(A_1 - A_5 - A_{10}) \\ &+ 3(A_{12} + A_6 - A_3) = -3(A_1 - A_8 - A_{10}). \text{ Hence, either } (-A_2 + A_7 + A_{11}) \\ &= -3, \text{ or } (A_1 - A_8 - A_{10}) = 0. \text{ Again, } (A_1 - A_8 - A_{10})(-A_4 + A_5 + A_{13}) \\ &= -3(-A_4 + A_5 + A_{13}). \text{ Hence, either } (A_1 - A_8 - A_{10}) = -3, \text{ or } \\ &(-A_4 + A_5 + A_{13}) = 0. \text{ Lastly, } (-A_2 + A_7 + A_{11})(-A_4 + A_5 + A_{13}) \\ &= -3(-A_2 + A_7 + A_{11}). \text{ Hence, either } (-A_4 + A_5 + A_{13}) = -3, \text{ or } \\ &(-A_2 + A_7 + A_{11}) = 0. \end{aligned}$$

$$\text{But } (A_1 - A_8 - A_{10}) + (-A_2 + A_7 + A_{11}) + (-A_4 + A_5 + A_{13}) = 0.$$

Hence each term can not equal -3, but must be 0.

$$\therefore \begin{cases} A_1 - A_8 - A_{10} = 0 \\ A_2 - A_7 - A_{11} = 0 \\ A_3 - A_6 - A_{12} = 0 \\ A_4 - A_5 - A_{13} = 0. \end{cases}$$

$$\text{Now } (-A_1, A_8 - A_1, A_{10} + A_8, A_{10}) = -[3 + (-A_2 + A_7 + A_{11})] = -3.$$

$$A_1, A_8, A_{10} = A_1(A_2 - A_9) = A_3 + (A_1 - A_8 - A_{10}) = A_3.$$

$$\text{Hence, } A_1, -A_8, -A_{10} \text{ are the roots of } x^3 - 3x - A_3 = 0.$$

$$\text{Similarly, } A_2, -A_7, -A_{11} \text{ are the roots of } x^3 - 3x - A_5 = 0.$$

$$A_3, -A_5, -A_{13} \text{ are the roots of } x^3 - 3x - A_{12} = 0.$$

By induction we derive that for a regular polygon of  $n=3m$  sides:

$$A_1 - A_{m-1} - A_{m-2} = 0$$

$$A_2 - A_{m-2} - A_{m+2} = 0$$

$$\text{Generally, } A_s - A_{m-s} - A_{m+s} = 0.$$

To prove the general formula, throw it into its trigonometric form,

$$\cos \frac{s\pi}{3m} - \cos \frac{(m-s)\pi}{3m} - \cos \frac{(m+s)\pi}{3m} = 0, \text{ which follows since}$$

$$\cos \frac{(m-s)\pi}{3m} + \cos \frac{(m+s)\pi}{3m} = 2 \cos \frac{\pi}{3} \cdot \cos \frac{s\pi}{3m} = \cos \frac{s\pi}{3m}.$$

Again,  $(-A_1, A_{m-1} - A_1, A_{m-1} + A_{m-1}, A_{m+1}) = (A_2 - A_{m-2} - A_{m-2}) - 3A_m$   
 $= -3$ , since  $A_m$  is the unit radius.

$$A_1, A_{m-1}, A_{m+1} = A_1(A_2 - A_m) = A_1(A_2 - 1) = A_1 + A_3 - A_1 = A_3.$$

∴  $A_1, -A_{m-1}, -A_{m+1}$  are the roots of  $x^3 - 3x - A_3 = 0$ .

Similarly,  $A_2, -A_{m-2}, -A_{m+2}$  are the roots of  $x^3 - 3x - A_3 = 0$ .

Generally,  $A_s, -A_{m-s}, -A_{m+s}$  are the roots of  $x^3 - 3x - A_{3s} = 0$ ,

where  $s$  is any integer  $\leq \frac{m-1}{2}$ ; and  $A_3, -A_3, A_9, \dots, (-1)^s A_{3s}, \dots$  are

the  $\frac{m-1}{2}$  roots of the general equation (4) of Chapter II. for the regular  $m$ -gon.

If  $m$  is prime to 3, i.e., if  $n$  contains the factor 3 in but the first degree, one chord out of every group of three chords given above is a root of this equation. For,  $m$  being prime to 3, one and only one of the subscripts  $s, m-s, m+s$  is divisible by 3, as is seen by writing them respectively  $3m-s, m-s, 2m-s$ .

The remaining two chords in the group will be roots of a quadratic whose coefficients are linear functions of the roots of equation (4).

Thus, if  $m+s$  be divisible by 3,  $m-2s$  will also.

Then  $A_s - A_{m-s} = A_{m+s}$ ,  $-A_s, A_{m-s} = A_m + A_{m-2s} = 1 + A_{m-2s}$ .

Hence,  $A_s$  and  $-A_{m-s}$  are the roots of  $x^2 - A_{m-s}x - (1 + A_{m-2s}) = 0$ , in which  $A_{m+s}$  and  $A_{m-2s}$  are roots of the equation (4) for the regular  $m$ -gon.

Hence, if the  $\frac{m-1}{2}$  chords of the regular  $m$ -gon be found, we can find all the chords of the regular  $3m$ -gon by solving a series of quadratics.

However, if  $m$  is divisible by 3, i.e., if  $n$  contains the factor  $3^2$ , the three chords in each of the above groups must either all or none be roots of (4); for the subscripts  $s, m-s, m+s$ , are then either all or none divisible by 3 according as  $s$  is divisible by 3 or not. Hence we can neither lower the cubics nor avoid them.

*The regular  $3m$ -gon depends, therefore, for inscription upon the same equations as does the regular  $m$ -gon, if  $m$  be prime to 3; but depends upon one or more cubics in addition to the former equations, if  $m$  contains the factor 3.*

ERRATA in Chapter III p 376 line 1, for form read degree p 377 lines 4 and 5, extend radical sign over 2 ( $17 \pm 1$  17), line 14, for  $(-A_1 - 2A_2 + \dots)$  read  $-(A_1 - 2A_2 + \dots)$ , line 18, separate the two products thus ] : ( , line 21, for 2b read 2B.

## PASCAL'S ARITHMETICAL TRIANGLE.

By GEORGE LILLEY, Ph. D., LL.D., Ex-President of Washington State Agricultural College and School of Science, Portland, Oregon.

I do not remember of having ever seen an account of this interesting device in any of our American text books, and, so far as I am able to ascertain, it has not been published in this country. The accompanying diagram explains itself.

To find any number, in a triangle, take the sum of the number immediately above and the number immediately to the left of the required number, or take the sum of the numbers immediately above and to the left of the required number. Thus, the 7th number in the 4th row =  $28 + 56 = 84$ , or

$$28 + 21 + 15 + 10 + 6 + 3 + 1 = 84.$$

The numbers on the diagonals are the coefficients of the expansion of a binomial.

The  $m$ th number in the  $n$ th row is given by the formula

$$\frac{|m+n-2|}{|(m-1)|(n-1)}.$$

Thus, the 7th number in the 5th row

$$= \frac{|7+5-2|}{|(7-1)|(5-1)} = \frac{|10|}{|6|4} = \frac{1.2.3.4.5.6.7.8.9.10}{1.2.3.4.5.6.1.2.3.4} = 210., \text{ etc.}$$

## LOGICAL DEDUCTIONS FROM THE HYPOTHESIS THAT THE ANGLE-SUM IS LESS THAN TWO RIGHT ANGLES.

By Professor JOHN N. LYLE, Ph. D., Professor of Natural Science, Westminster College, Fulton, Missouri.

Let  $ECF$  be any individual rectilinear triangle whatever whose angle sum is assumed to be less than two right angles.

Produce the side  $EC$  to  $D$ . Then  $ECF + FCD = \text{Two right angles}$ .

(Prop. XIII. Book I. of Euclid's Elements.) But by hypothesis  $FEC + EFC + ECF < \text{Two right angles}$ . Therefore  $ECF + FCD > FEC + EFC + ECF$ . Take  $ECF$  from both members.

Then in accordance with Euclid's axiom 5,  $FCD > FEC + EFC$ .

That is, one logical deduction from our hypothesis is that the exterior angle  $FCD$  is greater than the sum of the two interior and opposite angles  $FEC$  and  $EFC$ .

Lay off  $FCH = EFC$ .

Since  $FCD > FCH$ ,  $CH$  must lie between  $CF$  and  $CD$ . Since  $FCH$  is equal to  $EFC$ , the line  $CH$  is parallel to the line  $EF$  according to proposition XXVII. Book I. of Euclid's Elements.

Euclid gives the following definition:

"Parallel straight lines are such as, being in the same plane, do not meet however far they are produced in both directions."

Since the lines  $CH$  and  $EF$  are parallel in the Euclidian sense they do *not* meet. Is the assumption that *there is a point* at which the two parallel lines meet "an extension" or a contradiction of Euclid's doctrine? Is it as difficult to accept as true Euclid's axiom 12 as the statement that there is a point at which two parallel straight lines meet? What Euclid calls his axiom 12 is regarded as a sound proposition although it may not be self-evident. *The statement that two parallel straight lines meet at a point called "infinity" is certainly not axiomatic and just certainly has never been demonstrated.*

Again, lay off the angle  $KCD = FEC$ .

Since  $KCD = FEC$ , the line  $CK$  is parallel to the line  $EF$  according to Proposition XXVIII. Book I. of Euclid's Elements.

Since the lines  $CK$  and  $EF$  are parallel in the Euclidian sense they do *not* meet.

Since by inference from hypothesis  $FCD > FEC + EFC$  and by construction  $FCH + KCD = EFC + FEC$  it follows that  $FCD > FCH + KCD$ . But if  $FCD$  is greater than  $FCH + KCD$ ,  $HCK$  must be a *real* angle.

It must be not only a *real* angle, but an *individual* angle; for according to the hypothesis from which we set out, the triangle  $ECF$  is an individual one, and hence  $HCK$  must be an individual angle.

It follows also that  $HCK$ , since it has but one value only for the same individual triangle  $ECF$ , can not be a variable. Further, if  $HCK$  is a real angle, it follows that  $HC$  and  $KC$  are separate and distinct lines, although shown by logical deduction from the initial hypothesis to be parallel to the same line  $EF$  in the sense that they do not meet it when produced. The conclusion that the straight lines  $HC$  and  $KC$  meeting at  $C$  are both of them parallel to the straight line  $EE$  contradicts the statements known as Playfair's axiom that "Two straight lines, which intersect one another, can not be both parallel to the same straight line."

If the angle sum is two right angles, it readily follows that the ex-

terior angle  $FCD$  is equal to the sum of  $FCH$  and  $KCD$  and that the lines  $CH$  and  $CK$  are coincident. This deduction is contradicted by the conclusion that  $CH$  and  $CK$  are separate and distinct lines deduced from the hypothesis that the angle sum is less than two right angles.

Are the lines  $CH$  and  $CK$  the boundary lines between the *cutting* and the *not cutting* lines referred to in Lobatschewsky's theory of parallels, theorem 16?

$CH$  as we have already seen is parallel to  $EF$  in the Euclidian sense; that is, these two lines will not meet however far they may be produced both ways.

$CH$  can not be one of Lobatschewsky's boundary lines through  $C$  for they are supposed by him *gradually to approach and ultimately to meet*  $EF$ .

It was deduced from the hypothesis that  $CK$ , also, is parallel to  $EF$  in the Euclidian sense, and hence can not be one of Lobatschewsky's boundary lines through  $C$ .

If  $CH$  and  $CK$  are Lobatschewsky's boundary lines an inconsistency in his "Imaginary Geometry" emerges for his boundary lines through  $C$  ultimately meet  $EF$  whereas  $CH$  and  $CK$  can not do so without discrediting Propositions XXVII and XXVIII of Euclid's Elements. From this point of view Lobatschewsky seems to contradict inferences logically obtained from the hypothesis that the angle sum is less than two right angles.

Lobatschewsky's System of geometry is made up of two parts, one of which is distinctively Euclidian and the other, distinctively anti-Euclidian called by him "Imaginary Geometry". The "Imaginary Geometry" part flatly contradicts the Euclidian part. If  $CH$  and  $CK$  are Lobatschewsky's boundary lines his "Imaginary Geometry" is seen to be inconsistent with itself.

The hypothesis of Lobatschewsky that the angle sum of a rectilinear triangle is less than two right angles contradicts the hypothesis of Euclid that it is equal to two right angles. According to the logical law of excluded middle, if one of two propositions that mutually contradict each other is true, the other must be false.

Let a straight line drawn in the plane of the triangle  $ECF$  through the point  $C$  be revolved about that point, will it occupy more than one position in which it does not cut the line  $EF$ ?

The answer *no* is returned by those geometers who accept two right angles as the angle sum of a rectilinear triangle. With them  $CH$  and  $CK$  are one and the same straight line.

The answer *yes* must be the logical reply of those who accept less than two right angles as the angle sum of a rectilinear triangle and who also accept the first twenty-eight propositions of Book I., Euclid's Elements. With them  $CH$  and  $CK$  must be regarded as separate and distinct lines although neither is supposed to cut  $EF$  in any point whatever.

The answer *yes* is given by Lobatschewsky. His doctrine is that there is through  $C$  a pencil of not-cutting lines between two boundary lines that

ultimately cut the line  $EF$ . These hypothetical boundary lines are called by him parallels.

These Lobatschewsky parallels are not Euclidian parallels, since according to Euclid's geometry but one straight line can be drawn through  $C$  in the plane of  $EF$  that does not cut  $EF$ .

Are the Lobatschewsky parallels in the same plane of those of Euclid or are they supposed to be on a pseudo-spherical surface? Lobatschewsky expressly says "rectilineal triangle." But a rectilineal triangle can not be drawn on a curved surface. Some of the followers of Lobatschewsky informs us, however, that the surface of Lobatschewsky's is not a Euclidian plane.

Is our Universe located in *one* space only or has Lobatschewsky discovered another and a different space to contain it — a space from which Euclid's 12th axiom is banished, where indeed the angle sum of a triangle is forever less than two right angles, where the strange device—"Hypothesis Anguli Acuti"—is emblazoned on all banners, where there are no planes but pseudo-spherical surfaces instead having negative curvature, and where there are no straight lines but lines lost eternally to rectitude.

For untold ages it has been believed that there is but *one* space, that in which the material bodies of the Universe are contained and through which they move in describing their orbits. This belief of the ages is contradicted by the Kantian Idealists who maintain that space is purely subjective, that is, that it is the product of and exists only in the human mind.

The mind of man cognizes but does not create space.

This belief of the ages referred to above is, also, discredited by Kantian agnostics and nihilists who doubt or deny the truth of the report made by our intelligence that material bodies occupy space and are contained in space. There has from the outset been an antagonism between the science of Physics and Kantian idealism, Nihilism and agnosticism.

The space in which our universe is contained is currently believed to be trinally extended. By that is meant that three straight lines only mutually perpendicular to each other can be drawn through any point.

If space is *extended* it must be objective to the human mind.

In *objective space* straight and curved lines, planes and curved surfaces, and volumes such as cubes, cones and spheres may be located.

To call a line a space of one dimension; and a surface, a space of two dimensions is an absurd use of language. Curved surfaces are found in space. To characterize *such surfaces* as *new species of space* is to subject the meaning of the word space to a strange, grotesque and irrational Metamorphosis.

We close this article with the remark that Euclid in his *Rebuto ad absurdum* process argues from false premises in order to show that they are false and Lobatschewsky in his Theory of Parallels argues from false premises with such plausibility and subtle sophistry as to allure many into accepting both premises and conclusions as sound geometry.

# ARITHMETIC.

Conducted by B. F. FINKEL, Kidder, Mo. All contributions to this department should be sent to him.

## SOLUTIONS TO PROBLEMS.

### 31. Proposed by I. L. BEVERAGE, Monterey, Virginia.

"A man wishes to know how many hogs at \$9, sheep at \$2, lambs at \$1, and calves at \$9 per head, can be bought for \$400, having of the four kinds, 100 animals in all. How many different answers can be given?"

[Satisfactory arithmetical solution desired.]

Solution by B. F. FINKEL, A. M., Professor of Mathematics and Physics, Kidder Institute, Kidder, Missouri.

The average price per animal =  $\$400 \div 100 = \$4.00$ .

	Dif.	Balance	Columns																
\$4	\$4	\$3	5 lambs	5 sheep	3	10	17	24	31	38	45	52	59						
	\$2	\$2	3 hogs &	3 hogs &	68	60	52	44	36	28	20	12	4						
	\$9	\$5	calves	calves	29	30	31	32	33	34	35	36	37						
			8	7															

For convenience of expression suppose the animals were bought at the prices named and sold at the average price \$4. Then a lamb bought for \$1 and sold for \$4 is a gain of \$3; a sheep bought for \$2 and sold \$4 is a gain of \$2; a hog bought for \$9 and sold for \$4 is a loss of \$5; and a calf bought for \$9 and sold for \$4 is a loss of \$5. The gains on the sheep and lambs must be balanced by the losses on the hogs and calves. The L. C. M. of \$3 and \$5 is \$15. If we gain \$3 on one lamb to gain \$15 we must take as many lambs as \$3 is contained in \$15, which are 5 lambs. If we lose \$5 on a hog and a calf, to lose \$15 we must take as many hogs and calves as \$5 is contained in \$15, which are 3 hogs and calves. In like manner, we find that we must take 5 sheep and 1 hog and 1 calf. Adding the balance columns, considering them as abstract numbers, we have 8 and 7.  $8 + 7 = 15$ .  $100 \div 15 = 6\frac{2}{3}$ . Multiplying the balance columns by  $6\frac{2}{3}$  and adding the results horizontally, we get  $33\frac{1}{3}$  lambs,  $33\frac{1}{3}$  sheep and  $33\frac{1}{3}$  hogs and calves, a result incompatible with the nature of the problem. Now it is clear that we must take a certain number of 8's + a certain number of 7's to make 100. Arithmetically, this can be done by trial only. We find by trial that two 8's and twelve 7's make 100. Hence, multiplying the column of 8 by 2 and the column of 7 by 12 and add the results horizontally we get 10 lambs, 60 sheep, and 30 hogs and calves. In like manner, we find that nine 8's and four 7's make 100. Multiplying the column of 8 by nine and the column of 7 by four, and adding the results horizontally we get 45 lambs, 20 sheep, and 35 hogs and calves. These are the only results that can be obtained by multiplying the balance columns by integral numbers. Since the numbers in the balance columns, when added horizontally give 5 as results, we may find a number of fifths times 8 and a number of fifths times 7

## PROBLEMS.

40. Proposed by F. P. MATZ, M. Sc., Ph. D., Professor of Mathematics and Astronomy in New Windsor College, New Windsor, Maryland.

Find the market-price of  $m=3\frac{1}{4}\%$ -stock, in order that it may yield  $n=3\frac{1}{8}\%$  interest after deducting  $d=\$ \frac{7}{8}$  from every  $S=\$12$ .

41. Proposed by F. P. MATZ, M. Sc., Ph. D., Professor of Mathematics and Astronomy in New Windsor College, New Windsor, Maryland.

If I gain \$2 in \$5 by selling a horse for \$150, what per cent. would I gain by selling the horse for \$120?

## SOLUTIONS TO PROBLEMS.

26. Comment by WOOSTER W. BEMAN, A. M., Professor of Mathematics, University of Michigan, Ann Arbor, Michigan.

Referring to solution 1, of problem 26, p. 351 of MONTHLY:—In general,  $a$ ,  $b$ , and  $c$  must be positive. The inequality  $a^2b^2c^2 > (a+b-c)^2(b+c-a)^2$  ( $c+a-b$ )<sup>2</sup> is not a legitimate consequence of the three preceding inequalities,  $a^2 > a^2 - (b-c)^2$ ,  $b^2 > b^2 - (c-a)^2$ , and  $c^2 > c^2 - (a-b)^2$ .

30. Proposed by C. A. ROBERTS, Long Bottom, Ohio.

Find the sum of  $n=10$  terms of the series  $1+15+55+134+265\dots$

Solution by H. C. WHITAKER, B. S., C. E., Professor of Mathematics, Manual Training School, Philadelphia, Pennsylvania; A. H. BELL, Hillsboro, Illinois; and P. S. BERG, Apple Creek, Ohio.

The first terms in the given series and in the successive orders of differences are 1, 14, 26, 13, 0; whence the sum

$$\begin{aligned}
 &= n + 14 \frac{n(n-1)}{1 \cdot 2} + 26 \frac{n(n-1)(n-2)}{1 \cdot 2 \cdot 3} + 13 \frac{n(n-1)(n-2)(n-3)}{1 \cdot 2 \cdot 3 \cdot 4} \\
 &= 10 + 630 + 3120 + 2730 = 6490.
 \end{aligned}$$

Also solved by B. F. Burleson, D. G. Dorrance, J. F. W. Scheffer, G. B. M. Zerr, and the Proposer.

31. Proposed by D. G. DORRANCE, Camden, New York.

Sum the series 1, 1, 2, 3, 5, 8, 13, 21, 34, 55, etc. to  $n$  terms. Also what is the  $n$ th term?

1. Solution by J. W. NICHOLSON, A. M., LL. D., President and Professor of Mathematics Louisiana, State University and Agricultural and Mechanical College, Baton Rouge, Louisiana.

The series is evidently the sum of the following series:

(a)	1	1	1	1	1	1	1	1	1	.	.	.	.
(b)		1	2	3	4	5	6	7	8	.	.	.	.
(c)				1	3	6	10	15	21	.	.	.	.
						1	4	10	20	.	.	.	.
							1	5	.	.	.	.	.
								.	.	.	.	.	.

The  $n$ th term of (a) is 1; the  $(n-2)$ th term of (b) is  $n-2$ ; the  $(n-4)$ th term of (c) is  $\frac{(n-3)(n-4)}{2}$ ; the  $(n-6)$ th term of (d) is  $\frac{(n-4)(n-5)(n-6)}{6}$ ; etc.

Therefore the  $n$ th term of the given series is

$$1 + (n-2) + \frac{(n-4)(n-3)}{2} + \frac{(n-6)(n-5)(n-4)}{2 \cdot 3} + \frac{(n-8)(n-7)(n-6)(n-5)}{2 \cdot 3 \cdot 4} + \dots \text{to } 0.$$

Again, the sum of  $n$  terms of (a) is  $n$ , of  $n-2$  terms of (b) is

$$\frac{(n-2)(n-1)}{2}, \text{ of } n-4 \text{ terms of (c) is } \frac{(n-4)(n-3)(n-2)}{2 \cdot 3}, \text{ etc.}$$

Therefore, the sum of  $n$  terms of the given series is

$$n + \frac{(n-2)(n-1)}{2} + \frac{(n-4)(n-3)(n-2)}{2 \cdot 3} + \frac{(n-6)(n-5)(n-4)(n-3)}{2 \cdot 3 \cdot 4} + \dots \text{to } 0.$$

## PROBLEMS.

42. Proposed by ALEXANDER MACFARLANE, A. M., Sc. D., LL. D., Cornell University, Ithaca, New York.

There are  $p$  electors and  $q$  candidates for  $r$  seats. Each elector has  $r$  votes, and he may distribute them as he pleases among the candidates. Find in how many different ways the voting may result, that is, the number of possible states of the poll.

43. Proposed by F. M. SHIELDS, Coopwood, Mississippi.

Four men,  $A$ ,  $B$ ,  $C$ , and  $D$ , start from the same place, the traveling rates of  $A$  and  $C$  are equal, and the traveling rates of  $B$  and  $D$  were as 17 to 18, respectively;  $B$  could travel one mile in 7 minutes and 12 seconds.  $A$  traveled *due west* a certain distance,  $B$  traveled *due north* the cube of  $A$ 's distance *plus* his distance;  $C$  traveled *due east* a certain distance, and  $D$  traveled *due south* the cube of  $C$ 's distance *plus* his distance; They all change directions, and  $A$  traveled *due north* a certain distance,  $B$  traveled *due east* the 5th power of  $A$ 's distance north;  $C$  traveled *due south* a certain distance, and  $D$  traveled *due west* the 5th power of  $C$ 's distance south, when it was found that the sum of the north and south distances traveled by  $B$  and  $D$  was 351090 feet, and the sum of the distances  $B$  and  $D$  traveled east and west was 5929200000 feet, and that the product of the distances that  $A$  and  $C$  traveled east and west *plus* the square of the difference of these distances, *plus one* was 3901; and

that the product of the distances that *A* and *C* traveled north and south *plus* the square of the difference *squared*, plus the product multiplied by the square of the difference, was 49410000 [equal to the following new formulas:  $(nn+d^2+1)=3901$ , and  $\frac{1}{2}(nn+d^2)^2+(nn \times d^2) = 49410000$ ]. How far on a line is each party from the starting place, and how long did it require for *B* and *D* each to make the entire trip from starting place to the end?

[The Proposer says: "A city lot at St. Andrews, Florida, will be given to the party sending the Editor the first correct answer to the above problem-No.43].

## GEOMETRY.

Conducted by B. F. FINKEL, Kidder, Mo. All contributions to this department should be sent to him.

### SOLUTIONS TO PROBLEMS.

#### 25. Proposed by L. B. FRAKER, Weston, Ohio.

The sides of a quadrilateral board are  $AB=7$  inches,  $BC=15$  inches,  $CD=21$  inches, and  $DA=13$  inches; radius of inscribed circle is 6 inches. (1) What are dimensions of the largest rectangular board that can be cut out of the given board, (2) largest square, (3) largest equilateral triangle? (Please solve without use of the calculus.)

#### II. Solution by Professor G. B. M. ZERR, A. M., Principal of High School, Staunton, Virginia.

From the solution of this problem on page 354, No. 10, Vol. I., we find for another set of values for the angles,  $A=112^\circ 37' 11''$ ,  $B=126^\circ 52' 12''$ ,  $C=53^\circ 7' 38''$ ,  $D=67^\circ 22' 49''$ . This demonstrates that *AB* and *CD* are parallel. Since *CD* is the longest side and also parallel to *AB*, one side of the rectangle and square will coincide with *DC*. Let *KI* and *HI* be the sides of the rectangle.

Then  $\frac{1}{2}(AB+DC) \times EF = KI \times HI + \frac{1}{2}(AB+KI)(EF-HI) + \frac{1}{2}HI(DK+IC)$ .

$$\therefore \frac{1}{2}(7+21) \times 12 = KI \times HI + \frac{1}{2}(7+KI)(12-HI) + \frac{1}{2}(HI)(21-KI).$$

$$\therefore 126 = 6KI + 7HI. \text{ For a maximum } 6KI = 7HI.$$

$$\therefore HI = 9 \text{ inches, } KI = 10\frac{1}{2} \text{ inches.}$$

$$\therefore GHIK \text{ is the rectangle.}$$

$$\text{For the square } KI = HI.$$

$$\therefore 126 = 13KI, \therefore KI = 9.692 \text{ inches.}$$

$$\therefore LMNP \text{ is the square.}$$

For the triangle, draw *DR* making the angle  $RDC=60^\circ$ .

$$\text{Then } DR^2 = EF^2 + \frac{1}{4}DR^2.$$

$$\therefore \frac{3}{4}DR^2 = 144, DR^2 = 192,$$

$$DR = 13.856 \text{ inches.}$$

$$\therefore DRS \text{ is the triangle.}$$

The above solution is the result of suggestions from the Proposer.

31. Proposed by Professor G. I. HOPKINS, Manchester, New Hampshire.

A field is bounded as follows: N.  $14^{\circ}$  W. 15.2 chains; N.  $70^{\circ} 30'$  E. 20.43 chains; S.  $6^{\circ}$  E. 22.79 chains; N.  $86^{\circ} 30'$  W. 18 chains. A spring within it bears from the second corner S.  $75^{\circ}$  E. 7.9 chains. It is required to cut off 10 acres from the west side of the field by a straight fence through the spring. How far will it be from the first corner to the point at which the division fence meets the fourth side?

Solution by Wm. B. TIMMANS, Professor of Mathematics, St. Mary's College, St. Mary's, Ky.

Let  $CB$  and  $DA$  be extended to  $F$ , and  $E$  joined with  $F$ .

The bearings give the angles as follows:

$$\begin{aligned} \angle ABF &= 84^{\circ} 30'; \angle BAF = 72^{\circ} 30'; \\ \angle AFB &= 23^{\circ}; \angle EBF = 145^{\circ} 30'. \end{aligned}$$

I find  $AF = 38.722$ ;  $BF = 37.101$ ; and twice area of  $ABF = 561.34$  sq. ch. In  $\triangle EBF$  we have two sides and the included angle; from which I find  $EF = 43.8411$  ch.; the angle  $BFE = 5^{\circ} 51' 29''$ , and the angle  $EFB = 17^{\circ} 08' 31''$ .

Let  $GH$  be the required line; and call  $FH = x$ , and  $FG = y$ .

Hence, we have  $xy \sin 23^{\circ} = 561.34 + 200 = 761.34 = \text{twice area } GFH \dots (1)$ .  
 $43.8411 x \sin 5^{\circ} 51' 29'' + 43.8411 y \sin 17^{\circ} 08' 31'' = 761.34 = \text{twice area } GFH \dots (2)$ .

$$\text{From (1), } xy = \frac{761.34}{\sin 23^{\circ}} = 1949.398, \text{ and } x = \frac{1949.398}{y} \dots (3).$$

Substituting in (2) and reducing, I get  $y^2 - 58.946 y = -675.0486$ ,  
 $y^2 - 58.946 y + (29.473)^2 = -675.0486 + 868.672 = 193.6234$ ,

$$y - 29.473 = \pm 13.9148.$$

Using the *plus* sign (the *minus* sign cannot be used, as it would make  $G$  fall to the *left* of  $A$ ), we have  $y = FG = 43.3878$ ; and  $AG = 4.6658$  Ans.

I find  $BH = 7.828$ ;  $GH = 17.672$ ;  $FGH = 83^{\circ} 24' 09''$ ;  
 $FHG = 73^{\circ} 35' 51''$ .

Hence the *ten acre lot* is bounded as follows:

N $14^{\circ}$ W.	15.20 ch.
N $70\frac{1}{2}^{\circ}$ E.	7.828
S $3^{\circ} 05' 51''$ E.	17.672
N $86\frac{1}{2}^{\circ}$ W.	4.6658.

Solutions to this problem were received from G. B. M. Zerr, William E. Kern, H. C. Whitaker, P. H. Philbrick, J. M. Colaw, and A. H. Bell.

## PROBLEMS.

35. Proposed by LEONARD E. DICKSON, M. A., Fellow in Mathematics, The University of Chicago.

Determine the equation of lowest degree (cubic) upon which depends the inscription of the regular polygon of 37 sides.

36. Proposed by O. W. ANTHONY, Mexico, Missouri.

From two points, one on each of the opposite sides of a parallelogram, lines are drawn to the opposite vertices. Through the points of intersection of these lines a line is drawn. Prove that it divides the parallelogram into two equal parts.

## CALCULUS.

Conducted by J. M. COLAW, Monterey, Va. All contributions to this department should be sent to him.

### SOLUTIONS TO PROBLEMS.

18. Proposed by J. M. BANDY, A. M., Principal of High School, Ashboro, North Carolina.

If the ordinate  $ST$  of any point  $T$  on a circle

$$x^2 + y^2 = r^2$$

be produced so that  $ST:TP = r^2$ , prove that the whole area between the locus of  $P$  and its asymptotes is double the area of the circle.

III. Solution by ALFRED HUME, C. E., D. Sc., Professor of Mathematics, University of Mississippi, University, Mississippi.

If the ordinate is produced in both directions (upward and downward) there will be two points,  $P$  and  $P_1$ , located for every point,  $T$ , on the circle; and when  $T$  has moved over the upper half of the circle,  $P$  has traced the upper, and  $P_1$ , the lower curve.

$x$  and  $y$  being the co-ordinates of  $P$ ,  $ST = \sqrt{(r^2 - x^2)}$ .

For the upper curve,  $TP = y - \sqrt{(r^2 - x^2)}$ , and the equation is  $y_1 = \frac{2r^2 - x^2}{\sqrt{(r^2 - x^2)}}$ ,  $y_1$  being always positive.

For the lower curve,  $TP_1 = y_1 + \sqrt{(r^2 - x^2)}$ , and the equation is  $y_1 = \frac{x^2}{\sqrt{(r^2 - x^2)}}$ ,  $y_1$  being always negative.

Therefore the length of  $PP_1 (= PS + SP_1 = y + y_1)$  is  $\sqrt{(r^2 - x^2)}$ .

Total area between the curves and two common asymptotes ( $x = \pm r$ )  $= 2 \int_{-r}^r \frac{2r^2 dx}{(r^2 - x^2)} = \left[ 4r^2 \sin^{-1} \frac{x}{r} \right]_{-r}^r = 2\pi r^2$ .

[The solutions previously supposed an alteration to be made in the original statement of the problem. Prof. Hume thinks possibly the Proposer had the above in mind. We publish for comparison. —EDITOR.]

24. Proposed by C. W. M. BLACK, A. M., Department of Mathematics, Wesleyan Academy, Wilbraham, Massachusetts.

At the President's reception, the people are admitted at 12½ P. M.; but the line in front of the gate, begins to form at 11 A. M. By the time the doors are opened, there are in line 5400 citizens, who have gathered at a rate per second proportional to the time after 11 A. M. The President receives the citizens at the uniform rate of 45 per minute. At what time after 11 A. M. should a citizen join the line, in order that he may be delayed the least by the reception?

Solution by F. P. MATZ, M. Sc., Ph. D., Professor of Mathematics and Astronomy in New Windsor College, New Windsor, Maryland, and the PROPOSER.

Let  $T=5400$ , seconds = the line-formation time;  $P_1=5400$ , persons = the number of citizens in line at the expiration of the first second;  $x$  = the number of seconds after 11 A. M. a citizen should join the line, in order to suffer the least delay; and  $U$  = the number of seconds a citizen joining the line, would be delayed by the reception. The number of citizens joining the line, per second, forms during the time  $T$ , an arithmetical series in which  $a=P_1$ ,  $n=T$ ,  $d=P_1$ ,  $l=a+(n-1)d=TP_1$ , and  $s=\frac{1}{2}n(a+l)=\frac{1}{2}T(1+T)P_1=P_1 \therefore P_1=2P/T(T+1)$ ; and consequently, the number of citizens who joined the line during the  $x$ th second, is  $P_1x=2P^2x/T(T+1)$ . Hence the number of citizens in line at the expiration of the  $x$ th second, is

$$N=\frac{x(P_1+P_1x)}{2}, =\left(\frac{x(x+1)}{T(T+1)}\right)P_1 \dots (1).$$

Let  $R$  = the number of citizens the President receives per minute; then it will take  $60(N/R)$  seconds to receive  $N$  citizens. Since the citizens who will actually suffer the least delay has already been delayed  $(T-x)$  seconds (waiting in line), the expression for the total delay, in seconds, becomes

$$U=(T-x)+\frac{60}{R}\left(\frac{x(x+1)}{T(T+1)}\right)P_1=\text{a maximum} \dots (2).$$

$$\therefore \frac{dU}{dx}=-1+\frac{60}{R}\left(\frac{2x+1}{T(T+1)}\right)P_1=0 \dots (3).$$

and  $x=\frac{1}{2}\left[\frac{R}{60}\left(\frac{T(T+1)}{P_1}\right)-1\right]$ ,  $=2024\frac{1}{8}$  seconds; that is, the proper time for joining the line is 33 minutes  $44\frac{1}{8}$  seconds after 11 A. M. The total delay occasioned by the reception, is  $U=1$  hour 13 minutes  $7\frac{1}{8}$  seconds.

Also solved by C. E. White and G. B. M. Zerr.

## PROBLEMS.

32. Proposed by J. F. W. SCHEFFER, Hagerstown, Maryland.

Suppose it to be possible to perform the passage through the north pole: at what latitude would the maximum distance be saved by a ship sailing on the arc of a great circle instead of a parallel of latitude, the points of departure and destination being 180° apart? Also find the maximum saving.

33. Proposed by WILLIAM SYMMOND, A. M., Professor of Mathematics and Astronomy, Pacific College, Santa Rosa, California.

Show that of all curves of a given length, traced on one plane between two given points, and made to revolve around a common axis situated in that plane, the Catenary generates a minimum area.

## MECHANICS.

Conducted by B. F. FINKEL, Kidder, Mo. All contributions to this department should be sent to him.

### SOLUTIONS TO PROBLEMS.

12. Proposed by J. F. W. SCHEFFER, A. M. Hagerstown, Maryland.

A horizontal table without weight is supported on three points,  $A$ ,  $B$ , and  $C$ . A weight  $W$  is laid upon the table, at a point  $G$ . If  $AG=a$ ,  $BG=b$ ,  $CG=c$ ,  $\angle AGB=\alpha$ ,  $\angle BGC=\beta$ , and  $\angle CGA=\gamma$ , find the pressures upon  $A$ ,  $B$ , and  $C$ .

Solution by F. P. MATZ, M. Sc., Ph. D., Professor of Mathematics and Astronomy in New Windsor College, New Windsor, Maryland.

The momental equations with respect to  $AG$ ,  $BG$ , and  $CG$ , are respectively:

$$P_B \times b \sin(\pi - \alpha) = P_C \times c \sin \beta, \quad \therefore \frac{P_B}{P_C} = \frac{c \sin \beta}{b \sin \alpha} \dots (n).$$

$$P_C \times c \sin(\pi - \beta) = P_A \times a \sin[\gamma - (\pi - \beta)], \quad \therefore P_C = \left( \frac{a \sin \alpha}{c \sin \beta} \right) P_A \dots (n).$$

$$P_A \times a \sin(\pi - \gamma) = P_B \times b \sin[\alpha - (\pi - \gamma)], \quad \therefore P_B = \left( \frac{a \sin \gamma}{b \sin \beta} \right) P_A \dots (p).$$

Put  $K = \left( \frac{\sin \beta}{a} + \frac{\sin \gamma}{b} + \frac{\sin \alpha}{c} \right)$ ; then from the equation,  $P_A + P_B + P_C = W$ , we deduce the following *symmetrical* and elegant results:

$$P_A = \left( \frac{\sin \beta}{aK} \right) W, \quad P_B = \left( \frac{\sin \gamma}{bK} \right) W, \quad \text{and} \quad P_C = \left( \frac{\sin \alpha}{cK} \right) W.$$

#### Second Solution.

According to the logic of common-sense, why not write

$$P_A = \left( \frac{\triangle BCG}{\triangle ABC} \right) W, \quad P_B = \left( \frac{\triangle CAG}{\triangle ABC} \right) W, \quad \text{and} \quad P_C = \left( \frac{\triangle ABG}{\triangle ABC} \right) W;$$

and then with the heavy artillery of the higher mathematics *successfully defend* our position!

NOTE:—These two solutions are to take the place of the *first* solution of this problem published in the November MONTHLY.—F. P. M.

---

## PROBLEMS.

---

18. Proposed by ALFRED HUME, C. E., D. Sc., Professor of Mathematics, University of Mississippi, University, Mississippi.

An elliptic paraboloid whose equation is  $\frac{y^2}{a} + \frac{z^2}{b} = 2z$  has its axis vertical and vertex downward. If  $\mu$  be the co-efficient of friction, prove that a heavy particle will rest at any point of the surface below its intersection with the cylinder  $\frac{y^2}{a^2} + \frac{z^2}{b^2} = \mu^2$ .

19. Proposed by H. O. WHITAKER, B. Sc., M. E., Professor of Mathematics, Manual Training School, Philadelphia, Pennsylvania.

"There was an old woman tossed up in a basket,  
Ninety times as high as the moon."

What was her initial velocity, the resistance of the air being neglected?

---

## DIOPHANTINE ANALYSIS.

---

Conducted by J. M. COLAW, Monterey, Va. All contributions to this department should be sent to him.

---

## SOLUTIONS TO PROBLEMS.

---

15. Proposed by M. A. GRUBER, M. A., War Department, Washington, D. C.

(a) The difference of two odd squares is always divisible by 8. Corollary: Every odd square is of the form  $8a+1$

(b) The sum of two odd squares is two times an odd number.

I. Solution by ARTEMAS MARTIN, LL. D., U. S. Coast and Geodetic Survey Office, Washington, D. C.

(a) Every odd number is either of the form  $4m+1$  or of the form  $4m+3$ .

$$(4m+1)^2 = 16m^2 + 8m + 1 = 8(2m^2 + m) + 1;$$

$$(4m+3)^2 = 16m^2 + 24m + 1 = 8(2m^2 + 3m) + 1.$$

Hence every odd square is of the form  $8a+1$ , and any two odd squares may be represented by  $8p+1$  and  $8q+1$ ; their difference is  $8p-8q=8(p-q)$ .

$$\begin{aligned} (b) \quad (8p+1) + (8q+1) &= 8p+8q+2 = 2(4p+4q+1) \\ &= 2[2(2p+2q)+1] = 2[4(p+q)+1]. \end{aligned}$$

## PROBLEMS.

22. Proposed by G. B. M. ZERR, A. M., Principal of High School, Staunton, Virginia.

Decompose into the sum of two squares the product  $5 \times 13 \times 61$ .

23. Proposed by J. M. COLAW, A. M., Principal of High School, Monterey, Virginia.

Find three positive integral numbers such that the *product* of the first and the sum of the others is a square and the *sum* of their cubes is a square.

24. Proposed by F. P. MATZ, M. Sc., Ph. D., Professor of Mathematics and Astronomy in New Windsor College, New Windsor, Maryland.

Solve *generally*: The sum of the cubes of  $n$  consecutive numbers is a square. Determine the numbers, when  $n=2$ ,  $n=3$ ,  $n=4$ , and  $n=5$ .

## AVERAGE AND PROBABILITY.

Conducted by B. F. FINKEL, Kidder, Mo. All contributions to this department should be sent to him.

## SOLUTIONS TO PROBLEMS.

12. Proposed by G. B. M. ZERR, A. M., Principal of High School, Staunton, Virginia.

A large plane area is ruled by two sets of parallel equidistant straight lines, the one set perpendicular to the other. The distance between any two lines of the first set is  $a$ ; the distance between any two lines of the second set is  $b$ . If a regular polygon of  $2n$  sides be thrown at random upon this area, find the chance that it will fall across a line, the diameter of the circum-circle of the polygon being less than  $a$  or  $b$ .

### I. Solution by the PROPOSER.

Let  $2r$  be the length of the diagonal of the polygon,  $\theta$  its inclination to the length  $a$ .

Then if the centre of the polygon falls anywhere on the area  $\frac{1}{2}ab - (a - 2r \cos \theta)(b - 2r \cos \theta)$  it will fall across a line.

The limits of  $\theta$  are 0 and  $\frac{\pi}{2n}$ .

$$\therefore \text{Chance} = p = \frac{\int_0^{\frac{\pi}{2n}} \frac{1}{2}ab - (a - 2r \cos \theta)(b - 2r \cos \theta) d\theta}{\int_0^{\frac{\pi}{2n}} ab d\theta}$$

$$p = \frac{2r(a+b) \sin \frac{\pi}{2n} - \frac{\pi r^2}{n} - r^2 \sin \frac{\pi}{n}}{\frac{\pi ab}{2n}}$$

$$= \frac{4r(a+b)n \sin \frac{\pi}{2n} - r^2(2\pi + 2n \sin \frac{\pi}{n})}{\pi ab}.$$

$$\text{If } n=2, p = \frac{4r(a+b)\sqrt{2} - r^2(2\pi+4)}{\pi ab}.$$

\* Let  $l = 4rn \sin \frac{\pi}{2n}$  be the perimeter of the polygon.

$$\text{Then } p = \frac{(a+b)l - 2\pi r^2 - r^l \cos \frac{\pi}{2n}}{\pi ab}.$$

Let  $b$  be infinite.

Then  $p = \frac{l}{\pi a} = \frac{l}{\pi}$ , where  $l$  is the perimeter of the circle having  $a$  for its diameter.

Excellent solutions were received from *Professors Matz and Draughon*. Their solutions may appear in January Number.

## PROBLEMS.

22. Proposed by ALTON L. SMITH, Instructor in Drawing, Polytechnic Institute, Worcester, Mass.

In a series of counts of the votes on a legislative act relative to the city of Worcester, the following results were obtained:

	YES.	NO.
1st count	5566	5511
2nd "	5519	5558
3d "	5546	5517
4th "	5512	5551
5th "	5512	5541

What is the probability that the last count (5th) is correct?

23. Proposed by F. P. MATZ, M. Sc., Ph. D., Professor of Mathematics and Astronomy in New Windsor College, New Windsor, Maryland.

Find the average area of all the triangles that can be drawn *perpendicular-sided* to a given plane scalene triangle.

## EDITORIALS.

AN exhaustive solution to problem 33, Arithmetic Department, was received from A. H. Bell, but too late for credit in the proper place.

D. G. STANICE should have been credited with solving problem Arithmetic Department.

WE can furnish a limited number of complete sets of Vol. I, for \$2.00.

SEND all subscriptions by Money Order, or Draft, made payable to B. F. FINKEL.

DR. F. P. MATZ says: "Raise the subscription price of the MONTHLY no *stupid* person can see nor understand how you can give so much mathematics per year at \$2.00. Raise the subscription if you intend to keep the MONTHLY a monthly publication."

WE now ask our contributors to exercise the greatest care in preparing papers, problems, and solutions. Write and punctuate your contributions as you would wish to have them appear in print. This will be a great help to the editors and a source of pleasure to the readers.

PROFESSOR E. P. THOMPSON, of Miami University, Oxford, Ohio, says: "I am getting several mathematical periodicals, some foreign, and yours appears to fill a field that needs occupying. . . . I think your idea of monthly biographies an excellent one." Also by representing each branch of Elementary Mathematics by sets of problems and answers."

WE have contracted with our publishers to have the MONTHLY mailed to our subscribers between the 20th and 25th of each month, thus avoiding the irregularity that prevailed during the past year. This No. was mailed Jan. 23. The delay was unavoidable. We hope to get Jan. No. out in a few weeks and then have subsequent Nos. to appear within the terms of our contract.

One of the Editors of the Cosmopolitan Magazine is Arthur Sherburne Hardy, Ph. D., Professor of Mathematics in Dartmouth College and author of a text-book on Analytical Geometry, on Calculus, and on Quaternions. By special arrangements with the managers of the Cosmopolitan, we are enabled to offer a liberal commission to agents to canvass for that popular Magazine and the MONTHLY. Write to us at Kidder, Mo., for terms.

THERE are numerous typographical errors in the current volume. These are as annoying to the editors as to our readers. But when it is remembered that the JOURNAL is made up and proof read after hearing eight recitations per day it is not surprising that such errors should occur. Besides, unfortunately many parts of pages are printed without being proof-read at all, and the greater part of the JOURNAL is printed after one proof-reading. But errors of this nature we hope to reduce to a minimum, as we have determined to give every page a second proof-reading.

THIS number completes Volume I. of the AMERICAN MATHEMATICAL MONTHLY. It is not for us to praise the merits of our own Journal, though there are a few things we may say without violating any rules of propriety. The JOURNAL was started as an experiment. Had we consulted our financial interests only not a line would have been printed for we expected to lose some money. This expectation was based upon our own calculations and the experience of other pioneers in Mathematical Journalism. Our expectation in this respect has been fully realized, notwithstanding, that some of our warm friends not only trebled and quadrupled their subscriptions, but also paid for diagrams.

plates, and papers. But while we have realized a financial loss, our subscription list has come up to our estimation. More than this, we have the hearty co-operation of the best Mathematicians in America, which also will insure success to any magazine. These ardent workers are not only contributing articles to the MONTHLY which will be incorporated in the future literature of Mathematics, but are also putting forth a strong effort to extend the circulation of the MONTHLY. By these efforts the MONTHLY is gaining a high place among the magazines of the world. In view of these encouragements we have made arrangements to continue the publication of the MONTHLY, at least, another year, and we invite all of our present subscribers to continue with us and also to secure one or two new subscribers. By proper co-operation the enterprise can be made very successful. There is no reason why every Professor and Teacher of Mathematics in the United States should not become a subscriber. The JOURNAL is open to the publication of articles in every department of mathematics. Subscribers should not complain if each issue is not devoted entirely to the particular matter in which they are interested. Vol. I. contains 444 pages and as this large volume only costs \$2 no one should complain because it does not contain more.

A FEW weeks ago we purchased a set (4 Vols.) of the AMERICAN ENCYCLOPÆDIA DICTIONARY. This marvelous work, which was completed in Nov. 1894, contains 4,730 large folio pages. It is bound in substantial cloth and printed on good paper (the same as used in Webster's International) and in clear type. Thousands of copies of this work were sold through the coupon system by a paper in Chicago, the cost of the Dictionary thus being \$7.35 unbound, or \$10.55 bound in cloth. We shall take pleasure in sending this Dictionary bound in 4 volumes (cloth) to any of our readers on receipt of \$6.75; leather binding \$8.75. The Dictionary is no reprint, but entirely new and is worth, at least, \$40.00. Send in your order at once and secure a dictionary which is only surpassed (if surpassed at all) by the Century Dictionary.

*The American Mathematical Monthly in the Fortschritte der Mathematik:*

An extract from a letter to Dr. George Bruce Halsted from Dr. Paul Staackel of the University of Halle may be thus translated:

"HONORED SIR: At the meeting of scientists in Vienna, I met Professor Vasiliev of Kasan, who informed me that you would translate his Address at the Lobachevsky-commemoration. This news was very welcome to me, since I cannot understand Russian.

And now to day I have received this translation of yours, and desire to express my profoundest thanks.

You have, by the translation of this most interesting address established a claim to the thanks of the whole mathematical world!

I am much obliged to you for the AMERICAN MATHEMATICAL MONTHLY, which I follow with interest. I will give an account of it in the next volume of the *Fortschritte der Mathematik*."

THE MONTHLY will be continued as such the coming year and the price will not be increased. Vol. II. will contain about 400 pages. A number of

interesting papers will appear during the year. Trusting that the aid and sympathy of our friends may be relied upon for the new year and thanking you for past favors, we conclude the Old and begin the New.

## BOOKS.

*Exercices D'Arithmétique.* Enoncés et Solutions. Par J. Fitz-Patrick, Ancien Professeur de Mathématiques et Georges Chevrel, Directeur de L' Institution Charlemagne, a Tours. With a preface by M. Jules Tannery, Assistant Instructor at the High Normal School. Large 8vo. paper cover, 484 pages, Price, 10 francs. Paris: A. Hermann.

It is believed that there has never before been a work written of the nature of the one under consideration. The publisher in a letter to us says that he thinks there has never before been a work of this nature published either in Europe or America. The table of contents is as follows: Preface: Chapter I., Preliminary Definitions;-- Numeration: Chapter II., Addition and Subtraction: Chapter III., Multiplication: Chapter IV., Division: Chapter V., Divisibility of Numbers: Chapter VI., Common Divisor of Whole Numbers: Chapter VII., Prime Numbers: Chapter VIII., Fractions: Chapter IX., Decimal Fractions and Decimal Numbers: Chapter X., Ratios and Proportions: Chapter XI., Different Systems of Numeration: Chapter XII., Squares and Square Roots: Chapter XIII., Cubes and Cube Roots: Chapter XIV., Progression: Chapter XV., Miscellaneous Questions: Chapter XVI., Elementary Notions on the Theory of Numbers: Note by M. Matrot.

Each problem is completely solved.

To give our readers a better idea of the nature of this interesting work, we will translate a few of the questions.

Question 1. — *To investigate the change a number experiences, when we write out  $n$  more zeros between its digits.*

The authors first consider the case where one zero is written between the digits and take as an example, the number 6237. For this they write 62037, and show that  $62037 = 9 \times 6200 + 6237$ . Next they take 6204 and for it, write 620004. This is equal to  $99 \times 6200 + 6204$ . They next take the case where zeros are written between several digits of a number. As an example, they take 36356 for which 366390506 is substituted. This is shown to be equal to  $9 \times 36350 + 99 \times 363000 + 9 \times 3000000$ .

Question 285. — *A number divisible by 4 is always the difference of the squares of two whole numbers.*

Represent by  $4N$  any multiple whatever of 4.

$$\begin{aligned} \text{We have } 4N &= 2N + 2N = 2N + N^2 + 1 - N^2 - 1 + 2N \\ &= 2N + N^2 + 1 - (N^2 - 2N + 1) \\ &= (N+1)^2 - (N-1)^2. \end{aligned}$$

Question 403. — *Demonstrate that if  $\varphi(n)$  is a multiple of  $(n-1)$ , the number  $n$  is prime.*

Question 421. — *If  $a$  and  $b$  are two prime numbers, the expression  $a^{b-1} + b^{a-1} - 1$  is divisible by  $ab$ .*

Question 432. If the number  $2p+1$  is prime, the sum  $(1.2.3.4.\dots p)^2 + (-1)^p$  is divisible by  $2p+1$ .

These questions are sufficient to indicate the value of this fascinating work. It will be especially interesting to that class of Mathematicians who are fond of studying the curious combinations and properties of numbers. Under the Miscellaneous Questions are discussed, triangular numbers, quadrangular numbers, pentagonal numbers, etc. We take pleasure in recommending this work to all who are fond of this kind of Mathematical investigation.

B. F. F.

*The Elementary Properties of the Elliptic Functions with Examples.*  
By Alfred Cardew Dixon, M. A., Late Fellow of Trinity College, Cambridge;  
Professor of Mathematics at Queen's College, Galway. 8vo cloth, 142 pp.  
Price, \$1.25. New York: Macmillan and Co.

The object of this work is to supply the wants of those students who, for reasons connected with examinations or otherwise, wish to have a knowledge of the elements of Elliptic Functions, not including the Theory of Transformations and the Theta Functions.

*Preface.*

This little book gives a very full treatment of Elliptic Functions and is worthy a careful reading.

B. F. F.

## QUERIES AND INFORMATION.

Answer to Prof. Halsted's Query in June No., by Geno Lorea.....	367
Answers to Prof. Lyle's Queries on p. 102, by Prof. Halsted.....	175-176, 213-214
"An Unreasonable Rule," by Seth Pratt.....	247
" " " Again by Prof. Philbrick.....	331-332
A Reply to Prof. Whitaker's Comment, by H. W. Draughon.....	286
A Reply to Mr. Draughon, by H. C. Whitaker.....	410-411
Comment by Prof. Whitaker on Editor's Reply to L. B., p. 27.....	57
Curious Process for Maximum and Minimum, by Edmund Fish.....	332-3
Definition of a Fraction—A Query by H. C. K.....	331
Lobatchewsky's Triangle, by Prof. Lyle.....	247-248
Mathematics at Brooklyn, by G. B. Halsted.....	287
Note by J. H. Drummond to Prof. Dickson's Article on Triangles.....	56
Note to Article on p. 42, by G. B. Halsted.....	102
Note on Hayward's Solution to Ex. 3, p. 19, by Bradbury.....	176
Notes on Counsellor Dolman's Remarks in April No., by Lyle.....	408-410
Proofs in Wentworth's Geometry—Finkel.....	176
Quadrature of the Circle, by E. J. Goodwin.....	246
Queries by Prof. J. N. Lyle.....	102
Query by George Bruce Halsted.....	214
Query by John Dolman, Jr.....	289
Query by "Kendrick".....	289
Remarks on Prof. Steven's Article in April No., by C. D. Schmitt.....	214
Remarks on Division, by W. F. Bradbury.....	248
Reply to a Query.....	28
Reply to Query of "L. B.," by Editor Colaw.....	27-28
Resolutions at the Caen Congress—Halsted.....	368
Solution to a Probability Problem by Editor.....	28

## SOLUTIONS AND PROBLEMS.

### ARITHMETIC.

Acres in hexagonal field when A. equal No. boards in fence.....	20
Acres in rectangular " " " " " " " ".....	348
Agent for Company, to find bal. of acct.....	309
Animals, buying 100—how many different answers.....	430
Board, cutting to form a square.....	49
Board, cutting trapezoidal into two equal parts.....	126
Chicken, diamond in gizzard—to find gain or loss in selling.....	388
Circle, area of part between chords.....	193
Clock, when and what correct time.....	265
Corn, bushels bought and price.....	226
Debt, payment of part.....	226
Discount, date of.....	388
Estate divided.....	127
Farm, area of circular.....	193
Fractions, reduced.....	19
Horse, tied to sq. building—area grazed.....	431
House, equally distant from A, B, C.....	153
Logs piled—diam. of top log.....	125
Men, No. in militia.....	177

Money, borrowed and loaned (unsolved).....	264
Note, how long disc. before due.....	153
Note, given at bk.—to find p. c. paid.....	152
Profit and Loss, problems in.....	19, 76, 226
Pyramid. Vol. of pentagonal.....	76
Quotation, No. of ways can be read.....	310
Rope, length to draw from well.....	127
Ship, division of purchase money.....	310
Spider, how long to crawl in rect. hall.....	264
Stakes, how many driven in square.....	191

## ALGEBRA.

Age problem.....	80
Algebraic equations solved.....	21, 78, 118, 129, 278, 349, 792
Apples, to find names of boys stealing.....	158
Bonds, price at which Gov. must sell.....	280
Eggs, selling in market.....	79
Equation, to find lost coefficient.....	194
Field, area and dist. from tree to corners.....	80
Horse, working capacity given to find formula for value.....	391
Inequality, solved.....	351
Money-box, amt. drawn out daily.....	154
Money loaned, to find payment made.....	196
Oarsman problem.....	789
Pole, three lads climbing.....	155
Potatoes, digging and pulling vines.....	350
Problem, the "Little German".....	392
Series, problems in.....	78, 313, 432
Tobacco, price of mixture.....	266
Track, money divided for ploughing circular.....	267
Trains, how pass them.....	196
Traveling, to find rate and distances.....	195
Triangle, dists. from pt. to angles to find sides.....	195, 312
Vessel, filling by pipes.....	79

## GEOMETRY.

Circle, thro' 2 points to draw two circles tangent to a.....	271
Circles, 3 touch and tangents meet, etc.....	82
Circles, 2 intersect, etc.....	160
Circles, thro' 2 points to pass four circles tangent to two.....	232, 269
Circles, circle bisecting circumfs. of 3 circles.....	270
Circles, from pt. in circl. lines drawn to angles of inscribed triangles.....	315
Circles, two intersecting have com. area—to find radius.....	395
Cistern, height water rises when cyl. laid in.....	315-316
Conoidal surface, to find vol. of.....	355
Ellipse, to find value of eccentric angles.....	352
Ellipse, equilat. triangle described on chord.....	198
Farm, 8 circular within—to find areas.....	197
Field, how far walk before turning in circular 10-acre.....	233
Lights, find pt. in plane of 3 equally illuminated.....	269
Field bound, etc., and containing a spring.....	435

Parabola, chord thro' straight line touching.....	131, 160
Plane, to find minimum dist. from points to .....	161
Quadrilateral board, to find max. rect., sq., and triangle in.....	354, 434
Quadrilateral, bisectors intersect, etc.....	23
Sphere, thro' 3 pts. to pass 2 sphl. surfs. tangent to.....	394
Spheres, to pass 4 sphl. surfs. tangent to two.....	199
Trapezium, sides of inscribed—to find diam. of circle.....	130, 159
Triangle, angles drawn to sides of isosceles.....	83
Triangle, to prove isosceles.....	131
Triangle, to find sides, etc.....	316
Triangle, line parallel to base in isosceles.....	355
Triangle, length of parallel bet. sides=sum of segments.....	395
Triangles, to find base of two rt. triangles.....	353
Trigonometrical problem.....	51
Wallis, expression for $\pi$ , to find.....	51, 82

#### CALCULUS.

Circle, area bet. locus of P and asymptotes=twice area of cir.....	272, 436.
Cup, Cyl. of max. capacity from material.....	204
Curve of pursuit in circular room.....	273
Cylinder, Vol. Com. to and Vol. generated by curve.....	87
Cylinder, dist. dove flies in unwinding string.....	88, 318
Differential equation, solved.....	396
Equation, to find $\frac{dy}{dx}$ for $x=0$ .....	203
Equation, differentiated.....	234
$F(x)$ , to determine, etc.....	132
Indeterminate form, to find value when $x=0$ .....	89
Integral, to find Elliptic of eq.....	356
Parabola, to find moment of inertia in .....	85
President receiving, when to join line to suffer least delay.....	437
Prism, length of ribbon and of curve in unwinding .....	202
Room, race in circular.....	273
Segment, to find Vol. generated by circular .....	234, 320
Solids, eqs. of given, when centres are coincident, to find Vol. of each and Vol. common to both .....	163
Steamers, one crossing course of another, etc .....	203, 320
Tangent, determine at point of a req'd locus .....	397
Towns, 3 in St. line—time to travel from B to C .....	87
Tree, board cut out in logging off .....	133
Triangle, to find max. area of, etc .....	86, 318
Triangle in circle, to find curve to which leg is tangent .....	204
Triangle, equilateral—Vol. of solid generated by revolving figure about altitude .....	357.

#### MECHANICS.

Air-bubble—spherical, to find diam. at point of starting.....	134
Bar, falling—to find angular velocity.....	238
Cavalry, effect of charge between light and heavy.....	205
Ladder, height man may ascend before begins to slip .....	321

Locus, to find locus of foot of Perpendicular from center of circle upon resultant acceleration .....	167
Parabola, position of focal chord down which body rolls in least time .....	96
Paraboloid, floating in a liquid—ratio of densities, etc .....	321
Race course, man, horse and buggy in—find pressure on ground .....	400
Sphere, how filled with water freezing—time of descent down plane .....	205, 236, 276.
Sphere, show that will slide and not roll rough inclined plane .....	359
Table, ball on 3 legged table to find weight on each leg, etc .....	166
Table, find pressure upon at three points .....	399, 438
Traveling, A and B from point in plane—to find dist. apart .....	96

#### DIOPHANTINE ANALYSIS.

Equation, find value of $x$ to render a square .....	97, 136
Four numbers, sum of fourth powers a square .....	401
Numbers—two, diff. of squares a cube, and diff. of cubes a square .....	95, 325
Numbers—three, sq. of sum of two less sq. of other equal a square .....	361
Odd square of form $4a+1$ : value of $a$ for $n$ th odd square .....	209
Odd squares, diff. of two $\div 8$ ; sum of two times odd No. ....	439
Square number, to divide into two parts each squares .....	94, 325
Three numbers, sum of sq. of any two less their product a square .....	268
Three numbers, sum of cubes a square, and sum of square a cube .....	363
Three whole numbers in Arith. prog.—sum of every two a square .....	96, 136, 169
Three whole numbers, sum of any two a cube .....	208, 279
Three numbers sum of whose 4th powers a square .....	279
Two numbers, each of them and their sum and diff. plus 1 squares .....	280, 325
Triangles, find initial terms in three series .....	402
$x^2 - Ny^2 = \pm 1$ , Solved by A. H. Bell .....	53, 93, 169, 239

#### AVERAGE AND PROBABILITY.

Box—rectangular, equal No. of white and black balls in—proba. of contact of white balls .....	211, 363.
Circles, Av. area of all circles tangent to two—Finkel .....	97
Deer, chance wounded will drop dead in park .....	170, 209
Diameters, avr. length of all in given ellipse .....	242, 281
Dice, find expectation in throwing .....	96
Dice, probability of throwing, by Zerr .....	55
Ellipse, find mean area of octagonal surface within .....	210, 241
Letter, probability came from Oshkosh .....	283
Numbers, 4 multiplied to find proba. last digit is 0 .....	328
Regular polygon thrown at random upon a ruled surface .....	441
Surface 1 ft. square, chance coin touches or intersects both diagonals .....	404
Triangle, find avr. area of, formed by joining angle of square with 2 pts. within .....	137.
Triangle, find av. area of, formed by joining corner of cube with 2 pts. within .....	405.
Triangle, mean area of all $\Delta$ 's with vertices upon surf. of given $\Delta$ , and bases parallel to base of given $\Delta = \frac{1}{2}A_0$ (area of given $\Delta$ ) .....	326.

#### MISCELLANEOUS.

Axes, find position in space at any assigned instant .....	101
--	-----

Cloud, two observations taken req'd direction of wind.....	284
Comet, how long can remain within earth's orbit.....	406
Cycloid, to divide arc of into 8 equal parts.....	99-100
Grindstone, to find thickness of outer edge that each may grind off 18 inches.....	173, §30.
Grindstones, two circular wearing out and No. of revolutions....	172, §29
Man, course of who walks towards sun from morning till night.....	212
Rain, how many tons will fall from cubic mile of air cooled.....	173
Trapezoids, give dimensions of 13 rational with given bisector.....	100
Triangle, general expression for co-ordinates of.....	244
Wires of 5 metals soldered, to find strenth of current in.....	244
